ECR Demo

The Scensrio

We will pull sample Docker image from docker hub and register it in AWS using ECR option in ECS.

1. pull from docker hub

```
$ docker image pull hello-world
```

2. to see the docker images run

```
$ docker images
```

3. from ECS open ECR
   - Repositories , create repository
   - make it public
   - give the repository a name : hello-world
   - everything else default
   - create repository
   - after creation Select the repositories and select: View Push Commands.
   - In our case we dont have to run the step 2 (2.Build your Docker image using the following command) becasue we already have the image
   - after pushing is completed , we copy the URL to use it with the ECS (task definition in the container sections)
